

**a** **$K$  producers**

latency  $L = aG$ ,  $G \sim \text{Geom}(p)$

mean  $\mu = a/p$

full buffer blocks  
the producer

stall while  
stock  $< m_S$

at most  $B + K$  accepted states exist at once

**b****rate**

$N_T, S, \mu, K$

point estimate  $T_{\text{rate}}$

not enough

**histogram**

adds peak, mean, all step counts

interval  $[H^-, H^+]$ ,  $H^+ < 2H^-$

error floor 1/3

**ordered trace**

adds the order of  $m_1, \dots, m_S$

$T^{\text{det}}$  exactly, in one pass
